

Get Equine Vaccinating Right

The Importance of Vaccines

- Horses are at risk for many diseases, and some are at higher risk than others.
- Vaccines stimulate a horse's immune system to help prevent infectious disease.

Types of Vaccines

- **Killed:** A killed vaccine is made from an organism that has been inactivated or killed by chemical or heat treatment
- **Modified-Live:** A modified-live vaccine is made with a weakened virus or bacterium that will not cause disease.

Know the Core Diseases

Core diseases¹

- Eastern/Western Equine Encephalomyelitis (EEE/WEE)
- Tetanus
- West Nile Virus (WNV)
- Rabies

Core vaccines are recommended for all horses because all horses are at risk of being exposed to these diseases.

Know the Risk-Based Diseases

Risk-based diseases¹

- Equine Influenza Virus (EIV)
- Equine Herpesvirus (rhinopneumonitis)
- Potomac Horse Fever
- Botulism
- Strangles
- Anthrax
- Leptospirosis
- Equine Viral Arteritis (EVA)

Risk-based vaccines are given based on risk assessment performed by a veterinarian. Criteria can include a horse's age, exposure level and geographic location.

The Importance of Current Flu Strains

- Equine flu vaccines must be updated to protect against the influenza strains currently circulating
- FL '13 is the most current equine flu vaccine strain against today's circulating EIV
 - FL '13 was exclusively identified by the Merck Animal Health Equine Respiratory Biosurveillance Program in conjunction with the University of California, Davis
- PRESTIGE[®] vaccines meet OIE recommendations and AAEP guidelines for Clade 1 and Clade 2 protection
 - FL '13 Clade 1
 - Richmond '07 Clade 2
 - KY '02 Clade 1

¹AAEP Vaccination Guidelines.
