

Goat Herd Health

The 4 Pillars of Goat Herd Health

The most complete and effective Herd Health Success Plan for producers includes four key steps.

Identify

- The first step to managing animal health is identifying the individual to support and providing customized treatment and performance tracking.
- With a toolkit of sizes, colors and types ALLFLEX® lets you sort, manage and market your herd like a pro.

Deworm

- Parasite resistance is a growing problem in the goat industry.¹
- The primary parasites of concern are barber pole worms (*Haemonchus*) and brown stomach worms (*Teladorsagia*) often found in grass pastures.¹
- Goat producers should develop sustainable management practices that include proper use of deworming products.
- SAFE-GUARD® (fenbendazole) is an effective and safe tool in the war on worms.

Vaccinate

- Goats need protection against common clostridial diseases that may be present in the environment.
- Clostridia are a class of anaerobic bacteria that form spores and are commonly found in soils and in the digestive tracts of people and animals.
- Goats can be exposed to these spores through eating contaminated feed or pastures and also through open wounds.
- BOVILIS® VISION® CD-T with SPUR® offers protection against the most common clostridial diseases affecting goats.

Control

- External parasites can stress your goats and rob your operation of production gains.
- Flies, lice, and ticks feed on body tissues and may transmit diseases to healthy animals or cause itching and irritation that may lead to bacterial infections.
- These pests are rarely fatal, but they can cause anemia, reduced weight gain and lowered milk production.
- ULTRA BOSS® is an easy to use, pour-on permethrin insecticide safe for use on lactating and non-lactating goats.

The 4 Pillars of Goat Herd Health

The most complete and effective Herd Health Success Plan for producers includes four key steps.

Identify ALLFLEX® Tags

Easily identify to support and provide customized treatment and performance tracking.

Deworm SAFE-GUARD® (fenbendazole) Suspension (Drench)

A single application, low-dose volume suspension with easy-to-use applicator gun for accurate, stress-free deworming.

Vaccinate BOVILIS® VISION® CD-T with SPUR®

Shown effective against:

- *Clostridium tetani* (Tetanus)
- *C. perfringens* Types C & D (Enterotoxemia)

Control ULTRA BOSS® SYNERGIZED DELICE®

An easy to use, pour-on permethrin insecticide safe for use on lactating and non-lactating goats.

Pour-on insecticide and premise spray for fly, gnat, mosquitoes, fleas and other insect prevention.

IMPORTANT SAFETY INFORMATION: Goats must not be slaughtered for food within 6 days following last treatment. Because a withdrawal time in milk has not been established, do not use in lactating goats.
