DON'T WAIT: PUPPIES NEED FLEA AND TICK PROTECTION, TOO!

Beyond the discomfort that flea and tick bites bring, they can also compromise your young pup's health.

- Ticks can transmit serious diseases, such as Lyme disease and Rocky Mountain Spotted Fever
- Fleas are the #1 cause of skin disease in dogs¹
- Fleas can transmit tapeworms

This is why flea and tick protection is so important! Ask us about a new product that provides just the right amount of coverage puppies need for their growing bodies. With proper care, you can trust that your puppy will be well-protected from the start.
