

**Revalor-G**  
(trenbolone acetate and estradiol)

**Make your stockers add up.**

## Grow stockers and revenue with REVALOR-G.

The #1 stoker implant, REVALOR-G is used in more stoker cattle than any other brand. In fact, it leads the next closest implant brand by more than 2-1.<sup>1</sup> It's just right for stockers.

### The right timeline.

The typical stoker grazing period is 150 days. A single REVALOR-G implant improves grazing performance for 150 days.

### The right dose.

At 40mg of trenbolone acetate and 8mg of estradiol, REVALOR-G is dosed for a stoker setting. Studies show no benefit at higher doses.<sup>2</sup>

### The right performance.

While on pasture, cattle implanted with REVALOR-G gain an average of 23 extra pounds with no negative effects on subsequent feedlot performance.<sup>3</sup>

### The right choice for any pasture or season.

Cattle implanted with REVALOR-G significantly outgained those not implanted even on low-nutrition, dormant winter pasture.<sup>4</sup>

### The right safety.

REVALOR-G shows no negative side effects in both steers and heifers and comes without a caution statement.<sup>5</sup>

With average daily gain that pays for the cost of the implant within a few days, REVALOR-G provides superior performance. Because proven ROI is just one more way Merck Animal Health works for you.<sup>6</sup>

**Learn what you and your stockers could gain at [RevalorG.com](http://RevalorG.com).**

**IMPORTANT SAFETY INFORMATION:** A withdrawal period has not been established for Revalor-G in pre-ruminating calves. Do not use in calves to be processed for veal. For additional information, please see the product label.
